

1 Learn action order before rewriting the representation.

Native predictive order
(by original terminal future-to-goal distance)

Decision-aligned relational order
(from complete-set relational evidence)

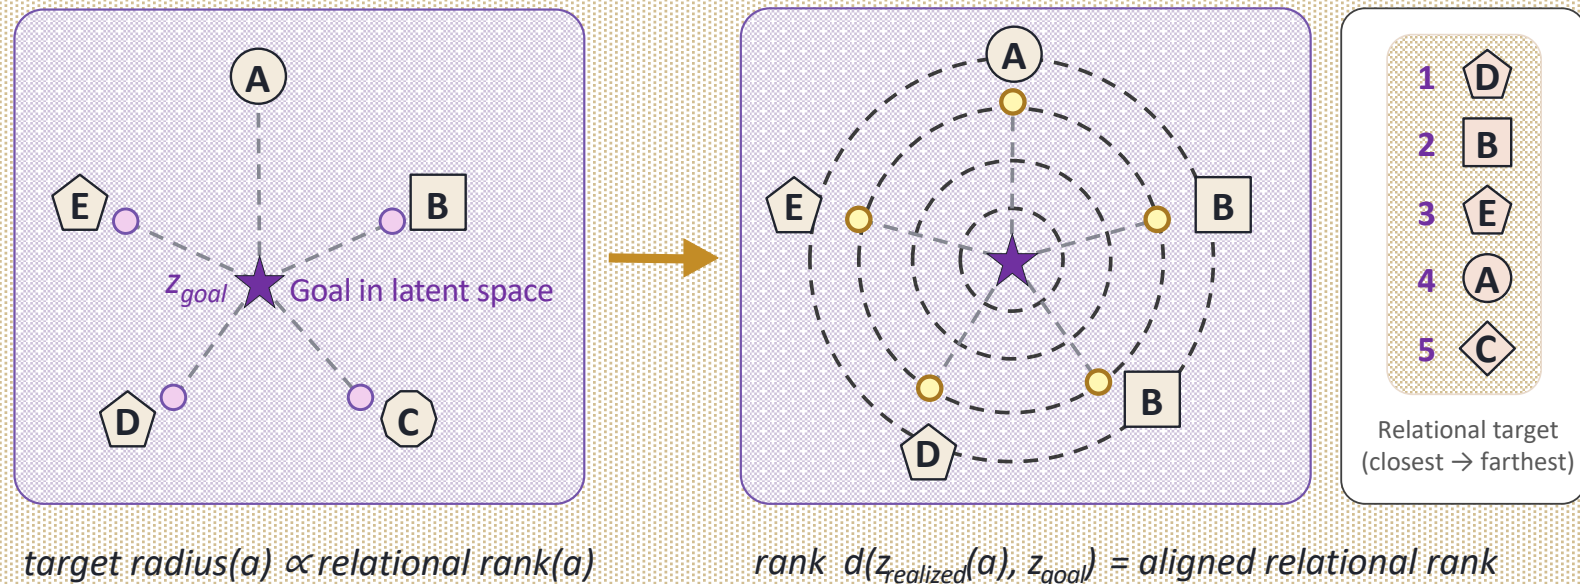

3 Exact Ordinal Realization

Encode the aligned order directly in future-to-goal distance.

Transported terminal futures (before)

Realized terminal futures (after)

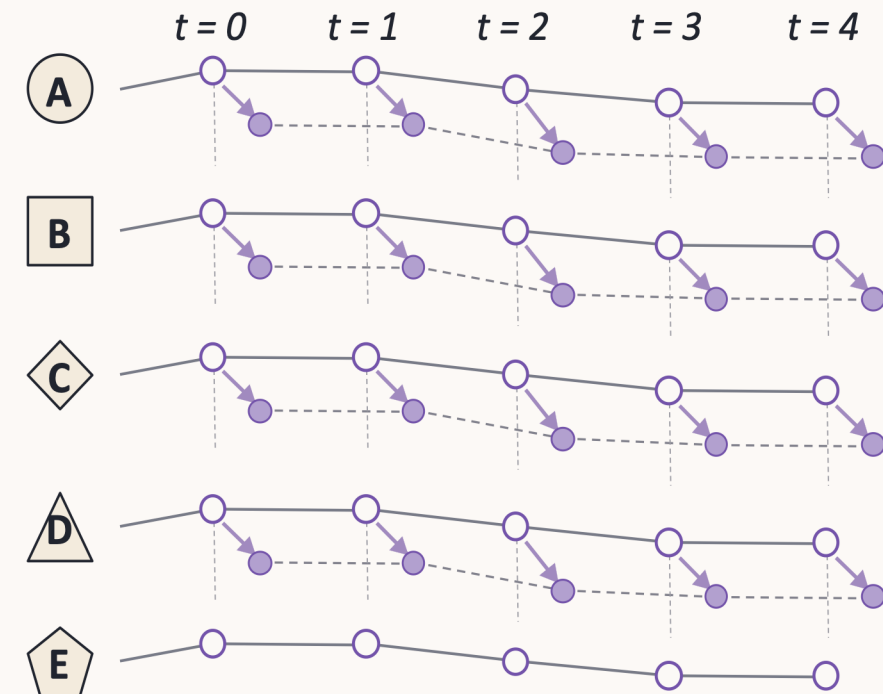

2 Bounded Temporal Transport

Learn a new multi-step future while preserving action correspondence.

(source future)
Native Predictive Future

(target multi-step future)
Decision-Aligned Future

Bounded residual displacement

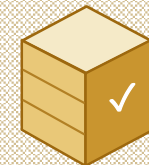

4 Single-Checkpoint DA-JEPA

Observation (context)

...

Predict future JEPA representations (realized)

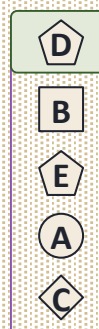

Native JEPA Criterion

$$a^* = \arg \min_a d(z_{future}(a), z_{goal})$$

Decision alignment lives in the future representation. One checkpoint. Native JEPA selection.
