

1

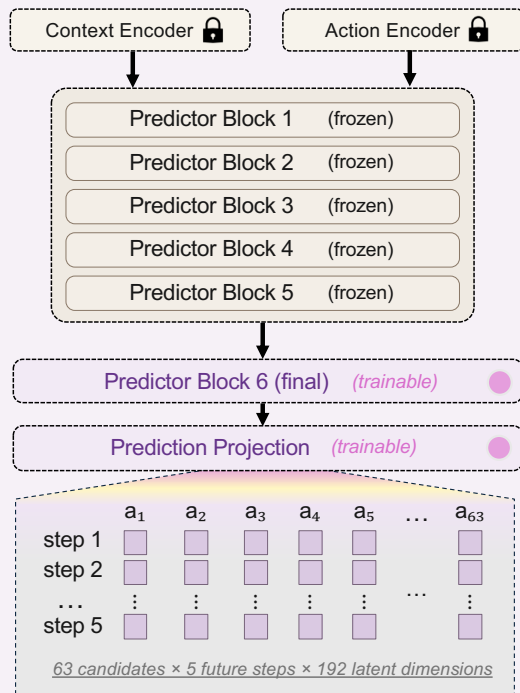

Complete counterfactual candidate set

2A

Predictive Plasticity

Adapt the decision-facing predictive representation.

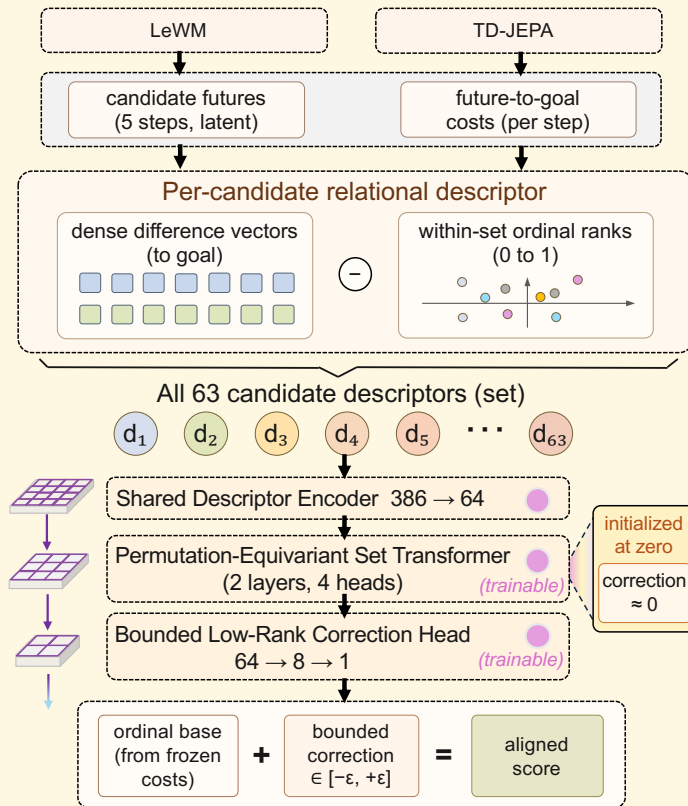

Training constraints

2B

Relational Alignment

Learn decision structure over the complete candidate set.

Confidence Gate (calibrated)

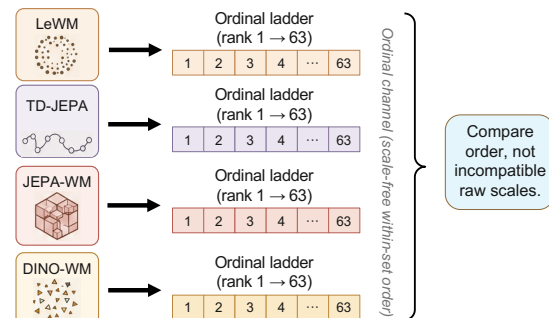

Keep ordinal base unless correction has sufficient calibrated advantage.

2C

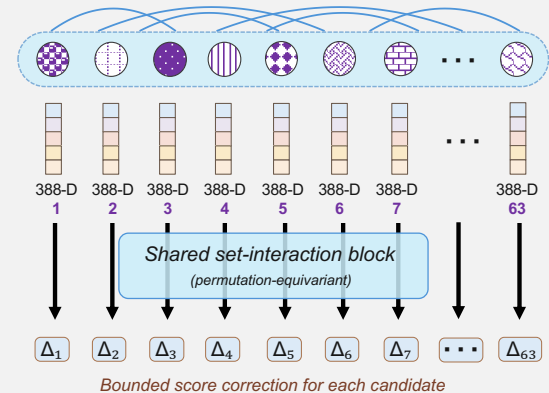

Multi-geometry alignment (MG)

Scale-free ordinal structure

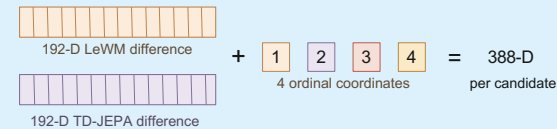

Convert each geometry's evidence to within-set ordinal coordinates (order, not scale).

Permutation-equivariant set interaction with bounded score correction

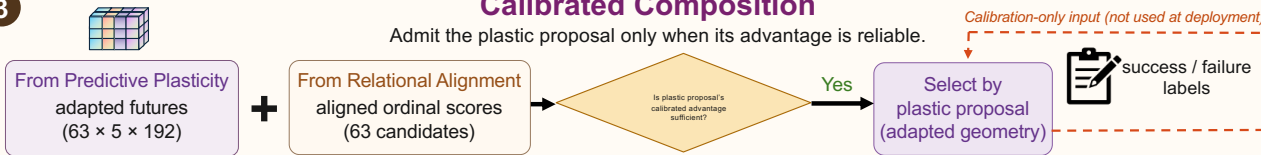

Per-candidate descriptor

3

Calibrated Composition

Admit the plastic proposal only when its advantage is reliable.

4

Decision-aligned candidate ordering
